An image print system including a client system connected to a server through the Internet. The client system makes an access to the server. In response to the access, the server delivers an application program including a reference image containing a picture pattern for detecting a controlled state of a display device in the client system. The client system displays on the display device the reference image taken by an image pickup device photographing an original image to be printed. Receiving the reference image data and the original image data from the image pickup device, the client system transfers them to the server. The server reproduces, in accordance with the reference image data, the original image data exactly as viewed on the display device, and supplies a printer with image data obtained by adding a print processing to the reproduced image data to be printed out. This enables the original image to be reproduced just as displayed on the display device of any user.
